

## Summary

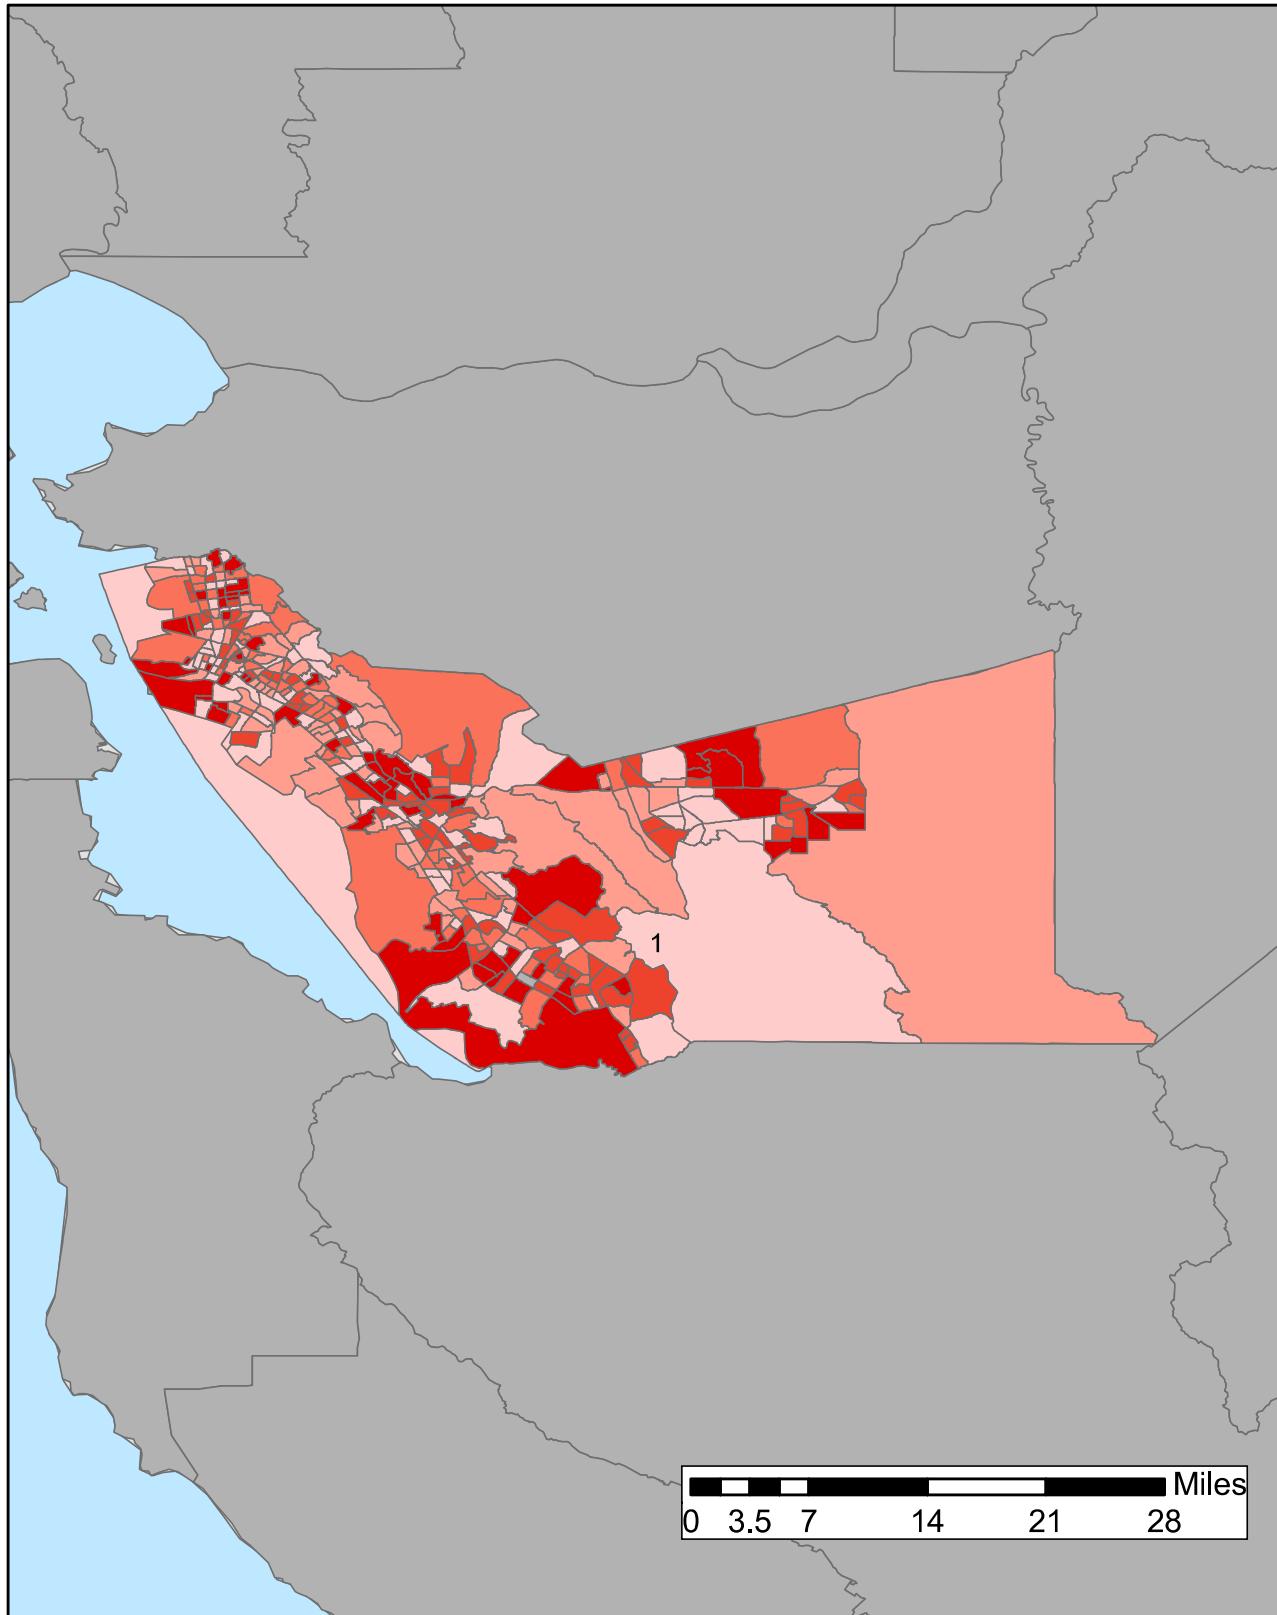

Every year the U.S. Census Bureau determines the poverty level each year, which is based on the number of individuals in a household and annual income before taxes. Many studies show that areas of high poverty also experience large amounts of pollution burden whether that be water contamination, ozone depletion, and toxic release. The atlas provided shows the percentage of households that fall under the poverty line in each census tract per county. It also shows the percentage of groundwater threat sites in each census tract per county. These sites can leak into the ground and also affect the soil and air. One large issue with groundwater threat sites is they are hidden, therefore they can purposely be ignored by those who don't want to take accountability but they can also be forgotten about causing serious damage to those living above. In many counties, such as Alameda County, there is a striking correlation between areas with high households under the poverty level and high numbers of groundwater threat sites.

## Automation in GIS

Automation in GIS seems to be a great thing. Especially for creating things like atlases and large amounts of data analysis. Automation allows people to work faster and produce more which ups efficiency. It is also good for producing large amounts of maps. With automation, I think it can be harder to check on each map and make sure there are no flaws or discrepancies. Even though automation makes things faster, having to go through each map can still be extremely time consuming. Another con to automation, which can also be a pro is uniformity. If you want all your maps to look similar and uniform it's great. But if you want to be creative with cartography, automation can make it difficult to achieve that.
